Total Batches

38

Avg Downtime / Batch

36.53

Operator-controllable

55.9%

Top 5 factors = 80% of downtime (min)

Line efficiency by operator

Downtime (min) by operator and factor

Operator	Batch change	Batch coding error	Inventory shortage	Machine adjustment	Machine failure
Charlie	10	44	17	118	85
Dee	20	30	85	79	36
Dennis		24	43	120	88
Mac	130	47	80	15	45

Downtime per batch (min)

The line runs at 64% efficiency, losing 1,388 min, and 5 factors cause 80% of it. 56% of that time is operator-controllable: Mac loses 130 of the 160 min on batch change, while Charlie, Dee and Dennis lose 79-120 min each on machine adjustment (Mac only 15). If operators cross-train both ways, about 392 min can be saved and efficiency can rise from 64% to about 71%.
